Download this website in a single [pdf file](#).

This page describes how this website is setup.

## 1.1 Setup

1. Install the dependencies in `./docs/requirements.txt`.

```
sphinx==4.3.2
sphinx-autodoc-typehints==1.12.0
sphinx_rtd_theme==1.0.0
sphinxcontrib-bibtex==2.4.1
```

2. Use `sphinx-quickstart` to generate the skeleton. When it prompts:

```
Separate source and build directories(y/n)
```

Answer yes.

3. Edit `docs/source/conf.py` and add the following lines to it:

```
import sphinx_rtd_theme
extensions = [
    'sphinx.ext.autodoc',
    'sphinx.ext.autosummary',
    'sphinx.ext.githubpages',
    'sphinx.ext.mathjax',
    'sphinx.ext.napoleon',
    'sphinx.ext.todo',
    'sphinx.ext.viewcode',
    'sphinxcontrib.bibtex',
]

html_theme = 'sphinx_rtd_theme'

master_doc = 'index'
pygments_style = 'sphinx'
html_theme_path = [sphinx_rtd_theme.get_html_theme_path()]
smartquotes = False
html_show_sourcelink = True

html_context = {
```

(continues on next page)

(continued from previous page)

```
'display_github': True,
'github_user': 'csu-fangjun',
'github_repo': 'notes',
'github_version': 'master',
'conf_py_path': '/docs/source/',
}

html_theme_options = {
    'logo_only': False,
    'display_version': True,
    'prev_next_buttons_location': 'bottom',
    'style_external_links': True,
}
latex_engine = 'xelatex'
```

4. To generate the notes in pdf format, use `make latex`, which generates lots of `tex` files in `./build/latex`. Switch to `build/latex` and run `make`. Assume that you have installed the software to compile `tex` files. It will generate `notes.pdf`.

## 1.2 How to include code from a file

See <https://www.sphinx-doc.org/en/master/usage/restructuredtext/directives.html#directive-literalinclude>.

1. Show line number: `:linenos:`. By default, line number counts from 0. To add an offset, e.g., 10, to the line number, use `:lineno-start: 10`. Note: It still includes all the contents of the file.
2. To emphasize a line, specified lines, or specified line ranges, use: `:emphasize-lines: 10`, `:emphasize-lines: 10,12,14`, and `:emphasize-lines: 12,15-18`. Note: `emphasize` means to change the background color.
3. Set the language, e.g., `:language: python`.
4. Set the caption, e.g., `:caption: hello world`.
5. To include a function from the python file, use `:pyobject: my_func`.
6. To include specified lines, use `:lines:1,3,5-10,15-`. Note that if using this option, line number counts from 0. Use `:lineno-start: xx` to change the offset for display.

## 1.3 Link

See <https://sublime-and-sphinx-guide.readthedocs.io/en/latest/references.html> and <https://www.sphinx-doc.org/en/master/usage/restructuredtext/basics.html#hyperlinks>

### 1.3.1 hello

Here is a link to *hello*.

```
.. _Link to hello:
```

```
hello
```

```
-----
```

```
Here is a link to :ref:`Link to hello`.
```

This page describes commonly used git commands.

## 2.1 Commands

### 2.1.1 rev-parse

It is quite common to get the root directory of the repository with the command:

```
git rev-parse --show-toplevel
```

For instance, the above command executed in this repository prints something like as follows:

```
/xxx/notes
```

The following shows its usage in a Python script:

```
#!/usr/bin/env python3

import subprocess

d = (
    subprocess.check_output(["git", "rev-parse", "--show-toplevel"])
    .decode("ascii")
    .strip() # remove the trailing \n
)
print(d) # /path/to/notes
```

It can also be used in bash script:

```
root_dir=$(git rev-parse --show-toplevel)
echo "root_dir ${root_dir}"
```

help git-rev-parse outputs helpful information for git rev-parse. In particular, it explains the differences among HEAD~, HEAD~n, HEAD^, and HEAD^n. The following shows the help information about it:

```
<rev>^[<n>], e.g. HEAD^, v1.5.1^0
  A suffix ^ to a revision parameter means the first parent of that commit object. ^
  ↪<n> means the <n>th parent
```

(continues on next page)

(continued from previous page)

(i.e. `<rev>^` is equivalent to `<rev>^1`). As a special rule, `<rev>^0` means the commit itself and is used when `<rev>` is the object name of a tag object that refers to a commit object.

`<rev>~[<n>]`, e.g. `HEAD~`, `master~3`

A suffix `~` to a revision parameter means the first parent of that commit object. A suffix `~<n>` to a revision parameter means the commit object that is the `<n>`th generation ancestor of the named commit object, following only the first parents. I.e. `<rev>~3` is equivalent to `<rev>^^^` which is equivalent to `<rev>^1^1^1`. See below for an illustration of the usage of this form.

$A = A^0$   
 $B = A^1 = A^1_1 = A_{~1}$   
 $C = A^2$   
 $D = A^{11} = A^{1^1}_1 = A_{~2}$   
 $E = B^2 = A^{12}$   
 $F = B^3 = A^{13}$   
 $G = A^{111} = A^{1^1^1}_1 = A_{~3}$   
 $H = D^2 = B^{12} = A^{112} = A_{~2}^2$   
 $I = F^1 = B^{13} = A^{113}$   
 $J = F^2 = B^{132} = A^{1132}$

## 3.1 Installation

### 3.1.1 macos

Refer to <https://docs.docker.com/desktop/mac/install/>.

## **4.1 TikZ**

### **4.1.1 Basics**

This page describes commonly used git commands.

## 5.1 Decoding

```
CompactLattice compact_lat;  
decoder.GetLattice(true, &compact_lat);  
  
CompactLattice compact_best_path;  
CompactLatticeShortestPath(compact_lat, &compact_best_path);  
  
Lattice best_path;  
ConvertLattice(compact_best_path, best_path);  
  
std::vector<int32_t> tokens;  
std::vector<int32_t> words;  
LatticeWeight weight;  
GetLinearSymbolSequence(best_path, &tokens, &words, &weight);
```

- decoder/simple-decoder.{h,cc}

## 6.1 sort

Sort files in the folder `t`. The filename has the pattern `xxx.n.txt`, where `n` is some numerical value. Also, exclude `xxx.100.txt`.

```
find ./t -name "xxx*.txt" ! -name "xxx.100.txt" -print0 | sort -z -t. -k2 -n | xargs -r0
```

## 6.2 echo

Generate a binary file:

```
echo -n -e '\x30\x31\x32' > a.bin  
hexdump a.bin
```

## 6.3 ffmeg

```
ffprobe xxx.opus
```

### 6.3.1 Convert format

- opus to wav

```
ffmpeg -i input.opus output.wav  
  
ffmpeg -i input.opus -acodec pcm_s16le -ac 1 -ar 16000 output.wav
```

- Extract part of a file

```
# extract 30 seconds starting at offset 1 minute  
ffmpeg -i input.opus -ss 60 -t 30 output.wav  
# or use HH:MM:SS format  
ffmpeg -i input.opus -ss 0:01:00 -t 0:00:30 output.wav
```

### 6.3.2 References

## CUDA

### 7.1 Installation

#### 7.1.1 CUDA 10.1.243

```
./cuda_10.1.243_418.87.00_linux.run --silent --toolkit --installpath=/ceph-data4/fangjun/  
↪software/cuda-10.1.243 --no-opengl-libs --no-drm --no-man-page  
  
# Install cuDNN  
cd /ceph-data4/fangjun/software/cuda-10.1.243  
tar xvf /ceph-sh0/fangjun/cudnn/cudnn-10.1-linux-x64-v8.0.4.30.tgz --strip-components=1
```

```
#!/usr/bin/env bash  
  
export CUDA_HOME=/ceph-data4/fangjun/software/cuda-10.1.243  
export PATH=$CUDA_HOME/bin:$PATH  
export LD_LIBRARY_PATH=$CUDA_HOME/lib64:$LD_LIBRARY_PATH  
  
# See /ceph-fj/fangjun/py38/lib/python3.8/site-packages/torch/share/cmake/Caffe2/Modules_  
↪CUDA_fix/upstream/FindCUDA.cmake  
export CUDA_TOOLKIT_ROOT_DIR=$CUDA_HOME  
export CUDA_TOOLKIT_ROOT=$CUDA_HOME  
export CUDA_BIN_PATH=$CUDA_HOME  
export CUDA_PATH=$CUDA_HOME  
export CUDA_INC_PATH=$CUDA_HOME/targets/x86_64-linux
```

#### 7.1.2 CUDA 11.0.3

```
./cuda_11.0.3_450.51.06_linux.run --silent --toolkit --installpath=/ceph-data4/fangjun/  
↪software/cuda-11.0.3 --no-opengl-libs --no-drm --no-man-page  
  
# Install cuDNN  
cd /ceph-data4/fangjun/software/cuda-11.0.3  
tar xvf /ceph-sh0/fangjun/cudnn/cudnn-11.0-linux-x64-v8.0.4.30.tgz --strip-components=1
```

### 7.1.3 CUDA 11.3.1

```
./cuda_11.3.1_465.19.01_linux.run --silent --toolkit --installpath=/ceph-data4/fangjun/  
↪software/cuda-11.3.1 --no-opengl-libs --no-drm --no-man-page  
cd /ceph-data4/fangjun/software/cuda-11.3.1  
tar xvf /ceph-sh0/fangjun/cudnn/cudnn-11.3-linux-x64-v8.2.1.32.tgz --strip-components=1
```

### 7.1.4 CUDA 11.5.2

```
./cuda_11.5.2_495.29.05_linux.run --silent --toolkit --installpath=/ceph-data4/fangjun/  
↪software/cuda-11.5.2 --no-opengl-libs --no-drm --no-man-page  
cd /ceph-data4/fangjun/software/cuda-11.5.2  
tar xvf /ceph-sh0/fangjun/cudnn/cudnn-linux-x86_64-8.3.2.44_cuda11.5-archive.tar.xz --  
↪strip-components=1
```

### 7.1.5 CUDA 11.6.1

```
./cuda_11.6.1_510.47.03_linux.run --silent --toolkit --installpath=/ceph-data4/fangjun/  
↪software/cuda-11.6.1 --no-opengl-libs --no-drm --no-man-page  
cd /ceph-data4/fangjun/software/cuda-11.6.1  
tar xvf /ceph-sh0/fangjun/cudnn/cudnn-11.3-linux-x64-v8.2.1.32.tgz --strip-components=1
```

## 8.1 torch.load and torch.save

Listing 1: ./code/load-and-save.py

```
1  #!/usr/bin/env python3
2
3  import torch
4  import tempfile
5
6
7  def main():
8      a = torch.arange(3)
9      with tempfile.NamedTemporaryFile() as f:
10         torch.save(a, f)
11         f.seek(0)
12         b = torch.load(f)
13         assert torch.all(torch.eq(a, b)), (a, b)
14
15
16 if __name__ == "__main__":
17     main()
```

## 8.2 torch.gather

Listing 2: ./code/gather.py

```
1  #!/usr/bin/env python3
2
3  import torch
4
5
6  def main():
7      left_context = 0
8      N = 1
9      T = 1
10     H = 5 # time1
11     W = 2 * H - 1 + left_context # 2time1 - 1 + left_context
```

(continues on next page)

(continued from previous page)

```
12 a = torch.randn(N, T, H, W)
13 a = torch.arange(N * T * H * W).reshape(N, T, H, W).contiguous()
14
15 if True:
16     rows = torch.arange(start=H - 1, end=-1, step=-1).unsqueeze(-1)
17     cols = torch.arange(H + left_context)
18     indexes = rows + cols
19
20     indexes = torch.tile(indexes, (N * T, 1))
21 else:
22     rows = torch.arange(start=H - 1, end=-1, step=-1)
23     cols = torch.arange(H + left_context)
24     rows = torch.cat([rows] * (N * T)).unsqueeze(-1)
25     indexes = rows + cols
26
27 print(indexes.shape)
28
29 ta = a.reshape(-1, W)
30
31 b = torch.gather(ta, dim=1, index=indexes)
32 b = b.reshape(N, T, H, -1)
33
34 c = a.as_strided(
35     (N, T, H, H + left_context),
36     (T * H * W, H * W, W - 1, 1),
37     storage_offset=H - 1,
38 )
39 assert torch.equal(b, c), (b, c)
40
41
42 if __name__ == "__main__":
43     torch.manual_seed(20220727)
44     main()
```

## 8.3 DDP

```

The output of `./main` is:

```

is training: 1
after m.eval(): is training: 0
5
6
7
[ CPUFloatType{3} ]

```

### 8.4.4 ArrayRef

See `c10/utils/ArrayRef.h`.

**Caution:** `IntArrayRef` is an alias to `ArrayRef<int64_t>`.

`ArrayRef<T>` contains only two members: A const data pointer and a size. It is trivially copyable and assignable.

It has similar methods like `std::vector`. It also has two methods to get the front and back: `front()` and `back()`; both return a const reference.

Its method `vec()` converts itself to a `std::vector` by **copying** the underlying data.

#### Constructors

#### Data members

Listing 10: `./code/array_ref/main.cc` (Check size)

```
1 struct Foo {  
2     const int32_t *p;  
3     size_t len;  
4 };  
5  
6 static void TestSize() {  
7     // Note: The data pointer in ArrayRef is const!  
8     static_assert(sizeof(torch::ArrayRef<int32_t>) == sizeof(Foo), "");  
9 }
```

#### Default constructed

Listing 11: ./code/array\_ref/main.cc (Default constructor)

```

1 static void TestDefaultConstructor() {
2     torch::ArrayRef<int32_t> a;
3     TORCH_CHECK(a.data() == nullptr);
4     TORCH_CHECK(a.size() == 0);
5     TORCH_CHECK(a.empty() == true);
6
7     TORCH_CHECK(a.begin() == nullptr);
8     TORCH_CHECK(a.end() == nullptr);
9 }

```

### From a single element

Listing 12: ./code/array\_ref/main.cc (From a single element)

```

1 static void TestFromSingleElement() {
2     int32_t a = 10;
3     torch::ArrayRef<int32_t> b(a);
4     TORCH_CHECK(b[0] == a);
5     TORCH_CHECK(b.data() == &a);
6     TORCH_CHECK(b.size() == 1);
7 }

```

### From an initializer list

Listing 13: ./code/array\_ref/main.cc (From an initializer list)

```

1 static void TestFromInitializerList() {
2     torch::ArrayRef<int32_t> a = {1, 2, 3};
3     TORCH_CHECK(a.size() == 3);
4     TORCH_CHECK(a[0] == 1);
5     TORCH_CHECK(a[1] == 2);
6     TORCH_CHECK(a[2] == 3);
7 }

```

### Other types of constructors

- From two pointers: begin and end
- From a pointer and a length
- From a *std::vector*
- From a container that has `data()` and `size()` methods
- From a C array
- From a *std::array*

## 8.4.5 ScalarType

See `c10/core/ScalarType.h` and <https://github.com/pytorch/pytorch/blob/master/torch/csrc/api/include/torch/types.h>.

ScalarType is an enum class, i.e., `enum class ScalarType : int8_t { ... }`.

### Members

It has the following members:

Listing 14: `./code/scalar-type/members.cc`

```

1  #define AT_FORALL_SCALAR_TYPES_WITH_COMPLEX_EXCEPT_COMPLEX_HALF(_) \
2      _(uint8_t, Byte) \
3      _(int8_t, Char) \
4      _(int16_t, Short) \
5      _(int, Int) \
6      _(int64_t, Long) \
7      _(at::Half, Half) \
8      _(float, Float) \
9      _(double, Double) \
10     _(c10::complex<float>, ComplexFloat) \
11     _(c10::complex<double>, ComplexDouble) \
12     _(bool, Bool) \
13     _(at::BFloat16, BFloat16)

```

### Some aliases

Listing 15: `./code/scalar-type/main.cc` (alias)

```

1  static void TestAlias() {
2      static_assert(c10::ScalarType::Int == c10::kInt, "");
3      static_assert(c10::ScalarType::Byte == c10::kByte, "");
4  }

```

Listing 16: `./code/scalar-type/alias.cc`

```

1  // See torch/csrc/api/include/torch/types.h
2  using Dtype = at::ScalarType;
3
4  /// Fixed width dtypes.
5  constexpr auto kUInt8 = at::kByte;
6  constexpr auto kInt8 = at::kChar;
7  constexpr auto kInt16 = at::kShort;
8  constexpr auto kInt32 = at::kInt;
9  constexpr auto kInt64 = at::kLong;
10 constexpr auto kFloat16 = at::kHalf;
11 constexpr auto kFloat32 = at::kFloat;
12 constexpr auto kFloat64 = at::kDouble;
13
14 /// Rust-style short dtypes.
15 constexpr auto kU8 = kUInt8;

```

(continues on next page)

(continued from previous page)

```

16 constexpr auto kI8 = kInt8;
17 constexpr auto kI16 = kInt16;
18 constexpr auto kI32 = kInt32;
19 constexpr auto kI64 = kInt64;
20 constexpr auto kF16 = kFloat16;
21 constexpr auto kF32 = kFloat32;
22 constexpr auto kF64 = kFloat64;

```

## ScalarType to CPP type

Listing 17: ./code/scalar-type/main.cc

```

1 static void TestScalarTypeToCppType() {
2     static_assert(
3         std::is_same<
4             int32_t, //
5             c10::impl::ScalarTypeToCppType<c10::ScalarType::Int>::type>::value,
6         "");
7 }

```

## CPP type to ScalarType

Listing 18: ./code/scalar-type/main.cc

```

1 static void TestCppTypeToScalarType() {
2     static_assert(
3         c10::CppTypeToScalarType<float>::value == c10::ScalarType::Float, "");
4 }

```

**Note:** It is `c10::impl::ScalarTypeToCppType`, but it is `c10::CppTypeToScalarType`.

## 8.4.6 TypeMeta

See

- <https://github.com/pytorch/pytorch/blob/master/c10/util/typeid.h>
- <https://github.com/pytorch/pytorch/blob/master/c10/core/ScalarTypeToTypeMeta.h>

struct `TypeMeta` contains only a single `int16_t` data member:

Listing 19: ./code/type-meta/main.cc (Check size)

```

1 static void TestSize() {
2     static_assert(sizeof(caffe2::TypeMeta) == sizeof(int16_t), "");
3 }

```

## Constructors

Listing 20: ./code/type-meta/main.cc (Make)

```
1 static void TestConstructor() {
2     caffe2::TypeMeta t = caffe2::TypeMeta::Make<int32_t>();
3     TORCH_CHECK(t.Match<int32_t>());
4
5     TORCH_CHECK(t.isScalarType());
6
7     TORCH_CHECK(t.isScalarType(torch::kInt));
8     TORCH_CHECK(t.isScalarType(torch::kFloat) == false);
9
10    TORCH_CHECK(t.name() == "int");
11 }
```

## Operations with ScalarType

Listing 21: ./code/type-meta/main.cc (Operations with ScalarType)

```
1 static void TestFromScalarType() {
2     caffe2::TypeMeta t = caffe2::TypeMeta::fromScalarType(torch::kDouble);
3
4     TORCH_CHECK(t.isScalarType(torch::kDouble));
5     TORCH_CHECK(t.name() == "double");
6
7     TORCH_CHECK(t.toScalarType() == torch::kDouble);
8     TORCH_CHECK(t == torch::kDouble);
9     TORCH_CHECK(t != torch::kFloat);
10    TORCH_CHECK(torch::kInt != t);
11 }
```

### 8.4.7 torch::Device

See

- <https://github.com/pytorch/pytorch/blob/master/c10/core/DeviceType.h>
- <https://github.com/pytorch/pytorch/blob/master/c10/core/Device.h>

#### DeviceType

`torch::DeviceType` is defined as enum class `Device: int8_t {...}`. The most commonly used types are `torch::DeviceType::CPU` and `torch::DeviceType::CUDA`, which are aliased to `torch::kCPU` and `torch::kCUDA`.

Listing 22: ./code/device/main.cc

```
1 void TestDeviceType() {
2     torch::DeviceType d = torch::kCPU;
3     std::ostringstream os;
4     os << d;
```

(continues on next page)

(continued from previous page)

```

5  TORCH_CHECK(os.str() == "cpu");
6
7  TORCH_CHECK(DeviceTypeName(d /*,lower_case=false*/ ) == "CPU");
8  TORCH_CHECK(DeviceTypeName(d, /*lower_case*/ true) == "cpu");

```

## Device

A `torch::Device` class has two members: a `torch::DeviceType` and an `int8_t index`.

Listing 23: `./code/device/main.cc` (Constructors)

```

1  void TestDeviceConstructorCPU() {
2      torch::Device d(torch::kCPU);
3      TORCH_CHECK(d.is_cpu() == true);
4      TORCH_CHECK(d.is_cuda() == false);
5      TORCH_CHECK(d.type() == torch::kCPU);
6      TORCH_CHECK(d.has_index() == false);
7      TORCH_CHECK(d.index() == -1);
8      TORCH_CHECK(d.str() == "cpu");
9  }
10
11 void TestDeviceConstructorCUDA() {
12     torch::Device d(torch::kCUDA, 3);
13     TORCH_CHECK(d.is_cpu() == false);
14     TORCH_CHECK(d.is_cuda() == true);

## 8.4.8 TensorOptions

See <https://github.com/pytorch/pytorch/blob/master/c10/core/TensorOptions.h>

### Constructors (not recommended)

Listing 24: ./code/tensor-options/main.cc (Not recommended constructors)

```

1 void TestConstructor() {
2     // not recommended
3     torch::TensorOptions opt1(torch::kCPU);
4     torch::TensorOptions opt2(torch::Device(torch::kCPU));
5     torch::TensorOptions opt3(torch::Device({torch::kCUDA, 1}));
6     torch::TensorOptions opt4("cpu");
7     // torch::TensorOptions opt5("CPU") // error;
8     torch::TensorOptions opt6("cuda:1");
9     // torch::TensorOptions opt7("CUDA:1"); // error
10
11     // not recommended, from a scalar type (implicit)
12     torch::TensorOptions opt8(torch::kInt32);
13 }

```

### Constructors (Recommended)

Listing 25: ./code/tensor-options/main.cc (Recommended constructors)

```

1 void TestConstructor2() {
2     // recommended
3     torch::TensorOptions opt1 = torch::dtype(torch::kFloat);
4     torch::TensorOptions opt2 = torch::dtype(caffe2::TypeMeta::Make<float>());
5     torch::TensorOptions opt3 = torch::device(torch::kCPU);
6     torch::TensorOptions opt4 = torch::device({torch::kCUDA, 1});
7     // Note: torch::device() returns a TensorOptions
8     // while torch::Device() is the constructor of a class
9
10    torch::TensorOptions opt5 = torch::requires_grad(true);
11    std::cout << opt5 << "\n";
12    // TensorOptions(dtype=float (default), device=cpu (default), layout=Strided
13    // (default), requires_grad=true, pinned_memory=false (default),
14    // memory_format=(nullopt))
15
16    torch::TensorOptions opt6 = torch::dtype<float>();
17    std::cout << torch::toString(opt6) << "\n";
18    // TensorOptions(dtype=float, device=cpu (default), layout=Strided (default),
19    // requires_grad=false (default), pinned_memory=false (default),
20    // memory_format=(nullopt))
21
22    std::cout << "default:" << torch::TensorOptions() << "\n";
23    // default:TensorOptions(dtype=float (default), device=cpu (default),
24    // layout=Strided (default), requires_grad=false (default),

```

(continues on next page)

(continued from previous page)

```

25 // pinned_memory=false (default), memory_format=(nullopt))
26 }

```

## Methods

Listing 26: ./code/tensor-options/main.cc (Methods)

```

1 void TestMethods() {
2     torch::TensorOptions opts = torch::dtype<float>();
3     TORCH_CHECK(opts.device() == torch::Device(torch::kCPU));
4     // It has not device_type!
5     TORCH_CHECK(opts.device() == torch::kCPU);
6     TORCH_CHECK(opts.device().type() == torch::kCPU);
7     TORCH_CHECK(opts.requires_grad() == false);
8

10         opts.device("cuda:2").dtype(torch::kInt).requires_grad(false);
11
12     TORCH_CHECK(opts2.dtype() == caffe2::TypeMeta::Make<int32_t>());
13     TORCH_CHECK(opts2.dtype() == torch::kInt32);
14     TORCH_CHECK(opts2.requires_grad() == false);
15 }

```

## 8.4.9 Tensor Creation

See

### TensorDataContainer

---

**Note:** data is **copied** to the returned tensor!

---

See

- <https://github.com/pytorch/pytorch/blob/master/torch/csrc/api/include/torch/detail/TensorDataContainer.h>
- [https://github.com/pytorch/pytorch/blob/master/tools/autograd/templates/variable\\_factories.h](https://github.com/pytorch/pytorch/blob/master/tools/autograd/templates/variable_factories.h)
- <https://github.com/pytorch/pytorch/blob/master/aten/src/ATen/Utils.cpp>

Support the following data types:

- From a `std::vector<T>`
- From a scalar
- From an initializer list
- From an `ArrayRef<T>`.

## From std::vector

Listing 27: ./code/tensor-creation/main.cc

```

1 static void FromStdVecotr() {
2     torch::Tensor t1 = torch::tensor(std::vector<int32_t>{1, 2, 3});
3     TORCH_CHECK(t1.scalar_type() == torch::kLong);
4     t1 = t1.to(torch::kInt);
5     const int32_t *p1 = t1.data_ptr<int32_t>();
6     TORCH_CHECK(p1[0] == 1);
7     TORCH_CHECK(p1[1] == 2);
8     TORCH_CHECK(p1[2] == 3);
9
10    torch::Tensor t2 = torch::tensor(std::vector<float>{1, 2, 3});
11    TORCH_CHECK(t2.scalar_type() == torch::kFloat);
12
13    torch::Tensor t3 =
14        torch::tensor(std::vector<double>{1, 2, 3}, torch::kDouble);
15    TORCH_CHECK(t3.scalar_type() == torch::kDouble);
16
17    torch::Tensor t4 =
18        torch::tensor(std::vector<double>{1, 2, 3},
19                      torch::dtype(torch::kDouble).device("cuda:0"));
20    TORCH_CHECK(t4.is_cuda());
21 }

```

## From scalar

Listing 28: ./code/tensor-creation/main.cc

```

1 static void FromScalar() {
2     torch::Tensor t = torch::tensor(3);
3     TORCH_CHECK(t.item<int64_t>() == 3);
4
5     torch::Tensor t2 = torch::tensor(0.5);
6     TORCH_CHECK(t2.scalar_type() == torch::kFloat);
7 }

```

## From initializer list

Listing 29: ./code/tensor-creation/main.cc

```

1 static void FromInitializerList() {
2     torch::Tensor t1 = torch::tensor({1, 2, 3});
3     torch::Tensor t2 = torch::tensor(std::vector<int32_t>{1, 2, 3});
4     TORCH_CHECK(torch::allclose(t1, t2));
5
6     torch::Tensor t3 = torch::tensor({{1, 2, 3}, {4, 5, 6}});
7     TORCH_CHECK(t3.dim() == 2);
8 }

```

(continues on next page)

(continued from previous page)

```

9  torch::Tensor t4 = torch::tensor({1, 2, 3});
10 torch::Tensor t5 = torch::tensor({4, 5, 6});
11 TORCH_CHECK(torch::allclose(t3[0], t4));
12 TORCH_CHECK(torch::allclose(t3[1], t5));
13 }

```

## From ArrayRef

Listing 30: ./code/tensor-creation/main.cc

```

1  static void FromArrayRef() {
2      int32_t i[] = {1, 2, 3};
3      torch::ArrayRef<int32_t> a(i);
4      torch::Tensor t = torch::tensor(a);
5      // Data is copied to t
6
7      TORCH_CHECK(t[0].item<int64_t>(), 1);
8      TORCH_CHECK(t[1].item<int64_t>(), 2);
9      TORCH_CHECK(t[2].item<int64_t>(), 3);
10 }

```

## 8.4.10 Tensor

16 assert a.isnan().item() is False
17
18 assert b.isinf().item() is False
19 assert b.isnan().item() is True

```

## 8.6 Note

To clip gradient, use:

```
tot_norm = torch.nn.utils.clip_grad_norm_(model.parameters(), max_norm=5, norm_type=2.0)
if torch.logical_or(tot_norm.isnan(), tot_norm.isinf()):
    # skip this update
    continue
else:
    optimizer.step()
```

## 8.7 Quantization

### 8.7.1 Internals

<https://github.com/pytorch/pytorch/blob/master/aten/src/ATen/core/QuantizerBase.h> defines the base class Quantizer.

<https://github.com/pytorch/pytorch/blob/master/aten/src/ATen/quantized/Quantizer.h> defines the subclasses of Quantizer, such as

- PerTensorAffineQuantizer - qscheme is kPerTensorAffine.

### QScheme

See <https://github.com/pytorch/pytorch/blob/master/c10/core/QScheme.h>

Listing 53: ./code/qscheme/main.cc

```
1  #include "torch/script.h"
2
3  static void TestQScheme() {
4      TORCH_CHECK(torch::toString(torch::kPerTensorAffine) == "per_tensor_affine");
5
6      TORCH_CHECK(torch::toString(torch::kPerChannelAffine) ==
7                  "per_channel_affine");
8
9      TORCH_CHECK(torch::toString(torch::kPerTensorSymmetric) ==
10                 "per_tensor_symmetric");
11
12     TORCH_CHECK(torch::toString(torch::kPerChannelSymmetric) ==
13                 "per_channel_symmetric");
14
15     TORCH_CHECK(torch::toString(torch::kPerChannelAffineFloatQParams) ==
16                 "per_channel_affine_float_qparams");
17 }
18
19 int main() {
20     TestQScheme();
21     return 0;
22 }
```

## PerTensorAffineQuantizer

It has 4 important methods:

- `QScheme qscheme() const`, always returns `kPerTensorAffine`.
- `double scale() const`
- `int64_t zero_point() const`
- `ScalarType scalar_type() const`

It uses `quantize_tensor_per_tensor_affine_cpu` when `FBGEMM` is available.

Otherwise, it uses <https://github.com/pytorch/pytorch/blob/master/aten/src/ATen/native/quantized/cpu/kernels/QuantizedOpKernels.cpp>

- For arm, it uses `quantize_tensor_arm`. It is a template with many specializations.
- For x86, it uses `quantize_val`
  - If `FBGEMM` is available, it uses `quantize_val`
  - Otherwise, it uses <https://github.com/pytorch/pytorch/blob/master/aten/src/ATen/native/quantized/AffineQuantizerBase.cpp>

```
template <typename T>
T quantize_val(double scale, int64_t zero_point, float value) {
    // std::nearbyint results in nearest integer value according to the current
    // rounding mode and the default rounding mode is rounds to even in half-way
    // cases in most popular processor architectures like x86 and ARM. This is
    // typically faster than an alternatives like std::round that rounds half-way
    // cases away from zero, and can be consistent with SIMD implementations for
    // example in x86 using _mm512_cvtps_epi32 or mm512_round_ps with
    // _MM_FROUND_CUR_DIRECTION option that also follow the current rounding mode.
    int64_t qvalue;
    constexpr int64_t qmin = std::numeric_limits<typename T::underlying>::min();
    constexpr int64_t qmax = std::numeric_limits<typename T::underlying>::max();
    float inv_scale = 1.0f / static_cast<float>(scale);
    qvalue = static_cast<int64_t>(zero_point + Round(value * inv_scale));
    qvalue = std::max<int64_t>(qvalue, qmin);
    qvalue = std::min<int64_t>(qvalue, qmax);
    return static_cast<T>(qvalue);
}
```

`dequantize_val` is defined as:

```
template <typename T>
TORCH_API float dequantize_val(double scale, int64_t zero_point, T value) {
    return static_cast<float>(scale) * (value.val_ - static_cast<int32_t>(zero_point));
}
```

## 8.7.2 torch.quantize\_per\_tensor

See [https://pytorch.org/docs/stable/generated/torch.quantize\\_per\\_tensor.html](https://pytorch.org/docs/stable/generated/torch.quantize_per_tensor.html)

```
def test_quantize_per_tensor():

## 9.1 asyncio

### 9.1.1 asyncio.Future

### 9.1.2 iterator

See <https://peps.python.org/pep-0234/>

### 9.1.3 yield

### 9.1.4 Hello World

#### Exercise 1

Listing 1: ./code/hello\_world/ex1.py

```
1 import asyncio
2
3
4 async def hello():
5     print("hello world")
6
7
8 asyncio.run(hello())
```

#### Exercise 2

Listing 2: ./code/hello\_world/ex2.py

```
1 import asyncio
2 import time
3
4
5 loop = asyncio.get_event_loop()
6
7
```

(continues on next page)

(continued from previous page)

```
8 @asyncio.coroutine
9 def hello():
10     print(f"hello {time.strftime('%X')}")
11     yield from asyncio.sleep(1)
12     print(f"world {time.strftime('%X')}")
13
14
15 if __name__ == "__main__":
16     loop.run_until_complete(hello())
```

## 9.1.6 TODOs

`asyncio.to_thread()` runs the function in an executor, where the default executor is a threadpool executor, which invokes `loop.run_in_executor()` indirectly.

How to set the executor of a loop? Maybe something related to `set_default_executor`?

If we want to schedule a callback to run in the loop from the C++ code, we can use `loop.call_soon_safe()` method.

## 9.2 argv

From the doc <https://docs.python.org/3/library/sys.html>:

The `list` of command line arguments passed to a Python script. `argv[0]` **is** the script name (it **is** operating system dependent whether this **is** a full pathname **or not**). If the command was executed using the `-c` command line option to the interpreter, `argv[0]` **is set** to the string `'-c'`. If no script name was passed to the Python interpreter, `argv[0]` **is** the empty string.

Note that `argv` is at least of size 1, though `argv[0]` may be an empty string.

```
import sys
print(sys.argv)
```

## 9.3 TODO

Python with zeroMQ (c extension)

## 9.4 time

```
import time
print(f'Started at {time.strftime("%X")}')
# do something
print(f'Finished at {time.strftime("%X")}')
```

## 9.5 Numbers

### 9.5.1 binary representation

Listing 3: `./code/numbers/representations.py`

```
1 print(bin(1)) # 0b1
2 print(bin(3)) # 0b11

```

## 9.7 enum

### 9.7.1 Hello

See <https://docs.python.org/3.11/howto/enum.html>

#### Enum

Note:

- It is iterable, i.e., supports `__iter__`
- name and value
- alias and `@unique`.
- `__members__`.
- `str` and `repr`.
- `auto`

Listing 5: `./code/hello/ex1.py`

```

1  from enum import Enum
2
3
4  class Color(Enum):
5      RED = 1
6      GREEN = 2
7      BLUE = 3
8      # BLUE = 4 # TypeError: Attempted to reuse key: 'BLUE'
9      ALIAS_FOR_RED = 1 # Use @unique to disallow this
10     MAX_COLOR = 4 # Note the naming convention
11
12
13  assert isinstance(Color.RED, Color)
14
15  assert str(Color(1)) == "Color.RED"
16  assert str(repr(Color(1))) == "<Color.RED: 1>"
17
18  assert Color.RED.name == "RED"
19  assert Color.BLUE.value == 3
20
21  print(list(Color))
22  print(type(list(Color)[0]))
23  for c in Color:
24      print(c, type(c))
25
26  """
27  [<Color.RED: 1>, <Color.GREEN: 2>, <Color.BLUE: 3>, <Color.MAX_COLOR: 4>]
28  <enum 'Color'>
29  Color.RED <enum 'Color'>
30  Color.GREEN <enum 'Color'>
31  Color.BLUE <enum 'Color'>

```

(continues on next page)

(continued from previous page)

```
32 Color.MAX_COLOR <enum 'Color'>
33 """
34
35 assert Color(1) == Color.RED
36 assert Color["RED"] == Color.RED
37 assert Color["ALIAS_FOR_RED"] == Color.RED
38
39 print(Color.__members__)
40 """
41 {'RED': <Color.RED: 1>, 'GREEN': <Color.GREEN: 2>, 'BLUE': <Color.BLUE: 3>, 'ALIAS_FOR_RED':
42  ↳<Color.RED: 1>, 'MAX_COLOR': <Color.MAX_COLOR: 4>}
```

## Flag

Listing 6: ./code/hello/ex2.py

```
1 from enum import Flag
2
3
4 class Weekday(Flag):
5     MONDAY = 1 << 0
6     TUESDAY = 1 << 1
7     WEDNESDAY = 1 << 2
8     THURSDAY = 1 << 3
9     FRIDAY = 1 << 4
10    SATURDAY = 1 << 5
11    SUNDAY = 1 << 6
12
13
14 assert Weekday.MONDAY.value == 1
15 assert Weekday.TUESDAY.value == 2
16 assert Weekday.WEDNESDAY.value == 4
17 assert Weekday.THURSDAY.value == 8
18 assert Weekday.FRIDAY.value == 16
19 assert Weekday.SATURDAY.value == 32
20 assert Weekday.SUNDAY.value == 64
21
22 weekend = Weekday.SATURDAY | Weekday.SUNDAY
23 print(weekend) # Weekday.SUNDAY|SATURDAY
24 print(repr(weekend)) # <Weekday.SUNDAY|SATURDAY: 96>
25 assert Weekday.SATURDAY in weekend
26 assert Weekday.SUNDAY in weekend
27 assert Weekday.MONDAY not in weekend
```

## auto

Listing 7: ./code/hello/ex3.py

```
1 from enum import Enum, Flag, auto
2
3
4 class Weekday(Flag):
5     MONDAY = auto() # start from 1
6     TUESDAY = auto()
7     WEDNESDAY = auto()
8     THURSDAY = auto()
9     FRIDAY = auto()
10    SATURDAY = 128
11    SUNDAY = auto()
12
13
14 assert Weekday.MONDAY.value == 1
15 assert Weekday.TUESDAY.value == 2
16 assert Weekday.WEDNESDAY.value == 4
17 assert Weekday.THURSDAY.value == 8
18 assert Weekday.FRIDAY.value == 16
19 assert Weekday.SATURDAY.value == 128
20 assert Weekday.SUNDAY.value == 256
21
22
23 class Color(Enum):
24     RED = auto() # start from 1
25     GREEN = auto()
26     BLUE = auto()
27     YELLOW = 10
28     WHITE = auto()
29
30
31 assert Color.RED.value == 1
32 assert Color.GREEN.value == 2
33 assert Color.BLUE.value == 3
34 assert Color.YELLOW.value == 10
35 assert Color.WHITE.value == 11
```

## 9.8 socket

### 9.8.1 AddressFamily

It is an IntEnum and all of its members are exported to socket.

Listing 8: ./code/address-family.py

```
1 import socket
2
3 print(list(socket.AddressFamily))
```

(continues on next page)

(continued from previous page)

```

4  """
5  [<AddressFamily.AF_UNSPEC: 0>, <AddressFamily.AF_UNIX: 1>,

8 <AddressInfo.AI_NUMERICSERV: 1024>]
9 """
10 assert socket.AI_PASSIVE == socket.AddressInfo.AI_PASSIVE

```

## 9.8.5 inet\_pton

[https://man7.org/linux/man-pages/man3/inet\\_pton.3.html](https://man7.org/linux/man-pages/man3/inet_pton.3.html)

Representation format to network address.

The resulting network address is in network order, i.e., big endian.

Listing 12: ./code/inet\_pton.c

```

1 #include <arpa/inet.h>
2 #include <stdio.h>
3
4 int main() {
5     struct in_addr addr;
6     int res = inet_pton(AF_INET, "192.168.1.2", &addr);
7     printf("%08x\n", addr.s_addr);
8     printf("192: %x\n", 192);
9     printf("168: %x\n", 168);
10    printf("1: %x\n", 1);
11    printf("2: %x\n", 2);
12    return 0;
13 }
14 #if 0
15 ./inet_pton
16 0201a8c0
17 192: c0
18 168: a8
19 1: 1
20 2: 2
21 #endif

```

Its implementation can be found at [https://github.com/bminor/glibc/blob/master/resolv/inet\\_pton.c](https://github.com/bminor/glibc/blob/master/resolv/inet_pton.c)

Listing 13: ./code/inet\_pton\_impl.c

```

## 9.8.7 Echo Server and Client

### Server

Listing 16: ./code/echo-hello/server.py

```

1  #!/usr/bin/env python3
2  import socket
3  import threading
4

```

(continues on next page)

(continued from previous page)

```
5 # nc localhost 6006
6
7
8 def run_server():
9     sock = socket.socket(family=socket.AF_INET, type=socket.SOCK_STREAM)
10    sock.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEADDR, 1)
11    sock.bind("", 6006)
12    # sock.setblocking(False) # It returns socket.BlockingIOError
13    sock.listen(2) # backlog is 2
14    while True:
15        client_sock, addr = sock.accept()
16        assert isinstance(client_sock, socket.socket)
17        assert isinstance(addr, tuple)
18        assert isinstance(addr[0], str)
19        assert isinstance(addr[1], int)
20        print("Connected from", addr) # Connected from ('127.0.0.1', 54266)
21        threading.Thread(target=handle_client, args=(client_sock,)).start()
22
23
24 def handle_client(sock: socket.socket):
25     while True:
26         data = sock.recv(1024)
27         if not data:
28             break
29         sock.sendall(data.decode("utf-8").upper().encode())
30     print("Disconnected from", sock.getpeername())
31     sock.close()
32
33
34 if __name__ == "__main__":
35     run_server()
```

To test the server, use `nc localhost 6006` or use the following client.

## Client

Listing 17: ./code/echo-hello/client.py

```

1 def main():
2     sock = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
3     sock.connect(("localhost", 6006))
4     for i in range(5):
5         sock.send("hello".encode())
6         b = sock.recv(1024)
7         print(b.decode())
8         time.sleep(0.5)

```

## Server2

With `concurrent.futures.ThreadPoolExecutor`.

Listing 18: ./code/echo-hello/server2.py

```

1  #!/usr/bin/env python3
2  import socket
3  import threading
4  from concurrent.futures import ThreadPoolExecutor
5
6  # nc localhost 6006
7  pool = ThreadPoolExecutor(max_workers=3)
8
9
10 def run_server():
11     sock = socket.socket(family=socket.AF_INET, type=socket.SOCK_STREAM)
12     sock.setsockopt(socket.SOL_SOCKET, socket.SO_REUSEADDR, 1)
13     sock.bind("", 6006)
14     # sock.setblocking(False) # It returns socket.BlockingIOError
15     sock.listen(2) # backlog is 2
16     while True:
17         client_sock, addr = sock.accept()
18         assert isinstance(client_sock, socket.socket)
19         assert isinstance(addr, tuple)
20         assert isinstance(addr[0], str)
21         assert isinstance(addr[1], int)
22         print("Connected from", addr) # Connected from ('127.0.0.1', 54266)
23         pool.submit(handle_client, client_sock)
24
25
26 def handle_client(sock: socket.socket):
27     while True:
28         data = sock.recv(1024)
29         if not data:
30             break
31         sock.sendall(data.decode("utf-8").upper().encode())
32     print("Disconnected from", sock.getpeername())
33     sock.close()
34
35

```

(continues on next page)

(continued from previous page)

```
36 if __name__ == "__main__":  
37     run_server()
```

### 9.8.8 TODOs

- Beej's Guide to Network Programming Using Internet Sockets  
<https://www.gta.ufrj.br/ensino/eel878/sockets/index.html>
- LWN.net Weekly Edition Archives  
<https://lwn.net/Archives/>

## 10.1 Install

### 10.1.1 formatter

Install <https://github.com/google/google-java-format>

```
wget https://github.com/google/google-java-format/releases/download/v1.15.0/google-java-format-1.15.0-all-deps.jar
```

Create a script with filename `google-java-format`:

```
#!/usr/bin/env bash

java -jar /ceph-sh0/fangjun/download/google-java-format-1.15.0-all-deps.jar $@
```

`chmod +x google-java-format` and add the path to `PATH`.

### 10.1.2 JDK

Go to <https://www.oracle.com/java/technologies/downloads/#java17> and download

```
wget https://download.oracle.com/java/17/latest/jdk-17_linux-x64_bin.tar.gz
mkdir /ceph-fj/fangjun/software/
tar xvf jdk-17_linux-x64_bin.tar.gz -C /ceph-fj/fangjun/software
```

And then set the following environment variables:

```
export JAVA_HOME=/ceph-fj/fangjun/software/jdk-17.0.3
export PATH=$JAVA_HOME/bin:$JAVA_HOME
```

## 10.2 Hello world

Listing 1: Hello.java

```
// Usage 1:
//  java Hello.java
// Usage 2:
//  javac Hello.java
//  java Hello
//
// Note:
//  - "javac Hello.java" generates a file "Hello.class"
//  - "java Hello" takes as input "Hello.class" and executes it
//
class Hello {
    public static void main(String[] args) {
        System.out.println("hello world");
    }
} // There is no ';' here
```

Listing 2: EqualTest.java

```
class EqualTest {
    public int i;

    public EqualTest(int a) {
        this.i = a;
    }

    public boolean equals(Object anObject) {
        if (this == anObject) {
            return true;
        }
        if (anObject instanceof EqualTest) {
            return this.i == ((EqualTest) anObject).i;
        }
        return false;
    }

    public static void main(String[] args) {
        EqualTest e1 = new EqualTest(10);
        EqualTest e2 = new EqualTest(10);

        System.out.println(e1 == e2); // false, compare the reference
        System.out.println(e1 != e2); // true
        System.out.println(e1.equals(e2)); // true, compare the contained value
    }
}
```

## 10.3 Reference

- <https://docs.oracle.com/javase/tutorial/>
- <https://docs.oracle.com/en/java/javase/17/docs/api/index.html>
- <https://github.com/openjdk/jdk.git>

Clone it and you can find the source code in `src/java.base/share/classes/java/lang/System.java` for `java.lang.System`.

## JAVASCRIPT

### 11.1 Hello world

```
console.log('hello world')  
console.log(eval('3 + 5'))
```

To write multi-line javascript, use shift + Enter for a new line.

```
(function(){  
    "use strict";  
    /* Start of your code */  
    function greetMe(yourName) {  
        alert('Hello ' + yourName);  
    }  
  
    greetMe('World');  
    /* End of your code */  
})();
```

It is case sensitive. Statements are separated by ;. Comments are the same as in C/C++.

#### 11.1.1 array

Listing 1: ./code/hello\_world/array.js

```
1 let a = [ 1, 2, 3 ];  
2 function sum(arr) {  
3     let s = 0;  
4     for (let x of arr) {  
5         s += x;  
6     }  
7     return s;  
8 }  
9 // Sum of the array [1,2,3] is 6  
10 console.log('Sum of the array [' + a + '] is ' + sum(a));  
11  
12 function sum2(arr) {  
13     let s = 0;  
14     for (let i = 0; i != arr.length; ++i) {
```

(continues on next page)

(continued from previous page)

```
15     s += arr[i];
16   }
17   return s;
18 }
19 console.log(sum2(a)); // 6
```

Note that there are two ways to iterate an array:

- `for(let x of array)`
- `for(let i = 0; i != array.length; ++i) { ... }`

To run the above code, use:

```
node array.js
```

## 11.1.2 class

Listing 2: `./code/hello_world/class.js`

```
1 class Point {
2   constructor(x, y) {
3     this.x = x;
4     this.y = y;
5   }
6
7   distance() { return Math.sqrt(this.x * this.x + this.y * this.y); }
8 }
9
10 let p = new Point(1, 1);
11 console.log(p.distance()); // 1.4142135623730951
```

It defines a `Point` class with two fields `x`, `y`. `Point` has two methods: a constructor and a method `distance()`.

Note that class names are by convention capitalized.

## 11.2 node

Go to <https://nodejs.org/en/download/> to download pre-built binaries:

```
wget https://nodejs.org/dist/v16.15.1/node-v16.15.1-linux-x64.tar.xz
tar xvf node-v16.15.1-linux-x64.tar.xz
```

and then add `/path/to/node-v16.15.1-linux-x64/bin/` to `PATH`.

## 11.3 TODOs

1. This page [https://developer.mozilla.org/en-US/docs/Learn/Getting\\_started\\_with\\_the\\_web/Installing\\_basic\\_software](https://developer.mozilla.org/en-US/docs/Learn/Getting_started_with_the_web/Installing_basic_software) lists some tools to minify code:
  - WebPack: <https://webpack.js.org/>
  - Grunt: <https://gruntjs.com/>
  - Gulp: <https://gulpjs.com/>
2. Color picker tool: [https://developer.mozilla.org/en-US/docs/Web/CSS/CSS\\_Colors/Color\\_picker\\_tool](https://developer.mozilla.org/en-US/docs/Web/CSS/CSS_Colors/Color_picker_tool)
3. Google font: <https://fonts.google.com/> and [https://developers.google.com/fonts/docs/getting\\_started](https://developers.google.com/fonts/docs/getting_started)

## 12.1 Hello world

Listing 1: hello\_world.html

```
<!DOCTYPE html>
<html>
  <head>
    <meta charset="utf-8">
    <title>Hello World</title>
  </head>
  <body>
    <p>Hello world</p>
  </body>
</html>
```

### 12.1.1 comments

```
<!-- this is a comment -->
```

### 12.1.2 images

```
</img>
</img>
</img>
```

### 12.1.3 ordered lists

```
<p> The following points </p>

<ol>
  <li> First </li>
  <li> Second </li>
</ol>
```

### 12.1.4 unordered lists

```
<p> The following points </p>

<ul>
  <li> foo </li>
  <li> bar </li>
</ul>
```

### 12.1.5 links

```
<a href="https://www.google.com">some text</a>
```

## 12.2 References

- Structuring the web with HTML  
<https://developer.mozilla.org/en-US/docs/Learn/HTML>

## 13.1 Hello world

### 13.1.1 comment

```
/* this is a comment */
```

```
p { color: red; }
```

Then, in some html file, use:

```
<link href="abc/foo.css" rel="stylesheet">
```

### 13.1.2 Selector

- tag name or element name: e.g., p selects <p>; h1 selects <h1>.
- ID:, e.g., #my-id selects <a id="my-id"> or <p id="my-id">
- class: e.g., .my-class selects <a class="my-class"> and <p class="my-class">
- attribute: e.g., img[src] selects  but not <img>

See [https://developer.mozilla.org/en-US/docs/Learn/Getting\\_started\\_with\\_the\\_web/CSS\\_basics#different\\_types\\_of\\_selectors](https://developer.mozilla.org/en-US/docs/Learn/Getting_started_with_the_web/CSS_basics#different_types_of_selectors) and [https://developer.mozilla.org/en-US/docs/Learn/CSS/Building\\_blocks/Selectors](https://developer.mozilla.org/en-US/docs/Learn/CSS/Building_blocks/Selectors) for more.

Example with multiple rules:

Listing 1: Example with multiple rules

```
p {  
  color: red;  
  width: 500px;  
  border: 1px solid black;  
}
```

Example with multiple selectors:

Listing 2: Example with multiple selectors

```
p, li, h1 { color: red; }
```

## **14.1 GIL**

## PROTOCOL BUFFERS

### 15.1 Installation

#### 15.1.1 C++

See <https://github.com/protocolbuffers/protobuf/blob/main/src/README.md>.

```
make protocol-buffers
cd protocol-buffers
wget https://github.com/protocolbuffers/protobuf/releases/download/v3.20.1/protobuf-all-
↪3.20.1.tar.gz
tar xvf protobuf-all-3.20.1.tar.gz
cd protobuf-all-3.20.1
./configure --prefix=$HOME/software/protobuf-3.20.1
make -j 20
make -j 10 check
make install 2>&1 | tee my-log.txt
cd $HOME/software/protobuf-3.20.1
tree . > tree-log.txt
```

```
$ export PKG_CONFIG_PATH=$HOME/software/protobuf-3.20.1:$PKG_CONFIG_PATH

$ pkg-config --cflags protobuf
-I/root/fangjun/software/protobuf-3.20.1/include

$ pkg-config --libs protobuf
-L/root/fangjun/software/protobuf-3.20.1/lib -lprotobuf

$ pkg-config --cflags --libs protobuf
-I/root/fangjun/software/protobuf-3.20.1/include -L/root/fangjun/software/protobuf-3.20.
↪1/lib -lprotobuf

$ pkg-config --libs-only-L protobuf
-L/root/fangjun/software/protobuf-3.20.1/lib

$ pkg-config --libs-only-l protobuf
-lprotobuf
```

```
$ export PATH=$HOME/software/protobuf-3.20.1/bin:$PATH
$ protoc --version
libprotoc 3.20.1
```

Listing 1: ./code/my-log.txt (Installation logs)

38 -----
39 Libraries have been installed in:
40   /root/fangjun/software/protobuf-3.20.1/lib
41
42 If you ever happen to want to link against installed libraries
43 in a given directory, LIBDIR, you must either use libtool, and
44 specify the full pathname of the library, or use the '-LLIBDIR'
45 flag during linking and do at least one of the following:
46   - add LIBDIR to the 'LD_LIBRARY_PATH' environment variable
47     during execution
48   - add LIBDIR to the 'LD_RUN_PATH' environment variable
49     during linking
50   - use the '-Wl,-rpath -Wl,LIBDIR' linker flag
51   - have your system administrator add LIBDIR to '/etc/ld.so.conf'
52
53 See any operating system documentation about shared libraries for
54 more information, such as the ld(1) and ld.so(8) manual pages.

## 15.1.2 Install with cmake

```

make protocol-buffers
cd protocol-buffers
wget https://github.com/protocolbuffers/protobuf/releases/download/v3.20.1/protobuf-all-
↪3.20.1.tar.gz
tar xvf protobuf-all-3.20.1.tar.gz
cd protobuf-all-3.20.1
mkdir my-build
cd my-build
cmake -Dprotobuf_BUILD_SHARED_LIBS=ON -DCMAKE_INSTALL_PREFIX=/ceph-fj/fangjun/software/
↪protobuf-3.20.1-cmake/ ../cmake 2>&1 | tee cmake-configure-shared-lib.log
make -j10 2>&1 | tee make-shared.log
make install 2>&1 | tee make-shared-install.log

cd $HOME/software/protobuf-3.20.1-cmake
tree . > tree-cmake-log.txt

```

## 15.2 Hello

### 15.2.1 hello.proto

See

- <https://developers.google.com/protocol-buffers/docs/cpptutorial>
- <https://developers.google.com/protocol-buffers/docs/pythontutorial>

Listing 3: ./code/hello.proto

```
1 syntax = "proto2";
2
3 package tutorial;
4
5 // available types:
6 // bool, int32, float, double, string
7 message Person {
8     optional string name = 1;
9     optional int32 id = 2;
10    optional string email = 3;
11
12    enum PhoneType {
13        MOBILE = 0;
14        HOME = 1;
15        WORK = 2;
16    }
17
18    message PhoneNumber {
19        optional string number = 1;
20        optional PhoneType type = 2 [ default = HOME ];
21    }
22
23    repeated PhoneNumber phones = 4;
24 }
25
26 message AddressBook { repeated Person people = 1; }
```

## 15.2.2 makefile

Listing 4: ./code/Makefile

```

1 .PHONY: all clean
2
3 all: hello.pb.cc hello.pb.h hello_pb2.py
4
5 hello.pb.cc hello.pb.h: hello.proto
6     protoc -I=./ --cpp_out=./ ./hello.proto
7
8 hello_pb2.py: hello.proto
9     protoc -I=./ --python_out=./ ./hello.proto
10
11 clean:
12     $(RM) hello.pb.cc hello.pb.h hello_pb2.py

```

### 15.2.3 hello.pb.h

Listing 5: ./code/hello.pb.h

```

An ELF linker. Read its source code!

## 18.2 Questions

1. How to view PLT?
2. How to view the relocation information? How many types of relocation are there?
3. What PIC code and non-PIC code look like?
4. What is lazy binding and how to use LD\_BIND\_NOW?
5. What is PLT and GOT?

## 19.1 aishell

### 19.1.1 AM training

The first one was added on 2019-02-01.

`asr_train.py` is in `espnet/bin/asr_train.py`, which invokes `espnet.asr.pytorch_backend.asr.train`.

The model is from `espnet.nets.pytorch_backend.e2e_asr.E2E`.

The encoder type *vggblstm*, 3 layers, hidden dim, 1024, proj dim 1024, subsampling 1\_2\_2\_1\_1.

Command is:

```
asr_train.py \  
  --config conf/train.yaml \  
  --preprocess-conf \  
  --ngpu 1 \  
  --backend pytorch \  
  --outdir exp/xxx \  
  --debugmode 1 \  
  --dict data/lang_char/train_sp_units.txt \  
  --minibatches 0 \  
  --verbose 0 \  
  --resume \  
  --train-json xxx/data.json \  
  --valid-json yyy/data.json
```

## 20.1 Tutorials

- <https://cmake.org/cmake/help/latest/guide/tutorial/index.html>

## 20.2 Install

Go to <https://github.com/Kitware/CMake/releases> for download.

```
wget https://github.com/Kitware/CMake/releases/download/v3.10.3/cmake-3.10.3-Linux-x86_
↪ 64.sh
chmod +x ./cmake-3.10.3-Linux-x86_64.sh
./cmake-3.10.3-Linux-x86_64.sh --help
mkdir /path/to/software/cmake-3.10.3
./cmake-3.10.3-Linux-x86_64.sh --prefix=/path/to/software/cmake-3.10.3 --skip-license
export PATH=/path/to/software/cmake-3.10.3/bin:$PATH
```

## HUGGINGFACE

### 21.1 spaces

#### 21.1.1 Install client API

```
pip install huggingface_hub
```

```
(py38) kuangfangjun:t$ python3
Python 3.8.0 (default, Oct 28 2019, 16:14:01)
[GCC 8.3.0] on linux
Type "help", "copyright", "credits" or "license" for more information.

```

To install the Python package:

```
cd ncnn
mkdir build
cd build
cmake ..
make -j
cd ..
pip install .
```

## 23.2 ncnn::Mat

- Use CHW format
- Support reference counting, like a smart pointer.

## 24.1 Installation

Refer to <https://llvm.org/docs/GettingStarted.html#requirements>

<https://llvm.org/docs/GettingStarted.html#getting-a-modern-host-c-toolchain> describes how to install GCC from source.

Use of a user provided GCC:

```
mkdir build
cd build
CC=$HOME/toolchains/bin/gcc CXX=$HOME/toolchains/bin/g++ \
  cmake .. -DCMAKE_CXX_LINK_FLAGS="-Wl,-rpath,$HOME/toolchains/lib64 -L$HOME/toolchains/
  ↳ lib64"
```

Useful tools that can be found in *build/bin*:

```
$ llvm-config --cxxflags
-I/ceph-fj/fangjun/open-source-2/llvm-project/llvm/include -I/ceph-fj/fangjun/open-
↳ source-2/llvm-project/build/include -std=c++14 -fno-exceptions -fno-rtti -D_GNU_
↳ SOURCE -D__STDC_CONSTANT_MACROS -D__STDC_FORMAT_MACROS -D__STDC_LIMIT_MACROS

$ llvm-config --libdir
/ceph-fj/fangjun/open-source-2/llvm-project/build/lib

$ llvm-config --cflags
-I/ceph-fj/fangjun/open-source-2/llvm-project/llvm/include -I/ceph-fj/fangjun/open-
↳ source-2/llvm-project/build/include -D_GNU_SOURCE -D__STDC_CONSTANT_MACROS -D__STDC_
↳ FORMAT_MACROS -D__STDC_LIMIT_MACROS

$ llvm-config --ldflags
-L/ceph-fj/fangjun/open-source-2/llvm-project/build/lib

$ llvm-config --src-root
/ceph-fj/fangjun/open-source-2/llvm-project/llvm

$ llvm-config --obj-root
/ceph-fj/fangjun/open-source-2/llvm-project/build

$ llvm-config --version
15.0.0git
```

(continues on next page)

(continued from previous page)

```
$ llvm-config --bindir  
/ceph-fj/fangjun/open-source-2/llvm-project/build/bin
```

## 24.2 ninja

```
pip install ninja
```

```
ninja
```

will look for the file *\$PWD/build.ninja*

```
ninja --help  
ninja -C build -j 20  
ninja -t targets  
ninja -t clean  
ninja -t cleandead  
  
ninja -v # be verbose while compiling files  
  
# suppose hello is a target  
ninja -v hello  
ninja -v -t clean hello  
  
ninja -n -v hello # dry run
```

## 24.3 Documentation

- Coding standard  
<https://llvm.org/docs/CodingStandards.html>
- LLVM Developer Policy  
<https://llvm.org/docs/DeveloperPolicy.html>
- doxygen doc  
<https://llvm.org/doxygen/>
- <http://www.aosabook.org/en/llvm.html>

## 24.4 Intermediate representation

```
clang --help
```

```
-emit-llvm  Use the LLVM representation for assembler and object files
-S          Only run preprocess and compilation steps
```

- `clang -S -emit-llvm ex.c` generates a text file `ex.ll`.
- `clang -c -emit-llvm ex.c` generates a binary file `ex.bc`.
- `llvm-dis ex.bc` generates a file `ex.ll`, which is identical with the file generated using `clang -S -emit-llvm ex.c`.`
- `llvm-as ex.ll` generates a file `ex.bc`, which is identical with the file generated using `clang -c -emit-llvm ex.c`.
- `llc ex.ll` generates the assembly file `ex.s`
- `lli ex.ll` can run this file. Use `echo $?` to see the return value.

See [https://llvm.org/devmtg/2019-04/slides/Tutorial-Bridgers-LLVM\\_IR\\_tutorial.pdf](https://llvm.org/devmtg/2019-04/slides/Tutorial-Bridgers-LLVM_IR_tutorial.pdf).

## 24.5 Install GCC

```
tar xvf gcc-12.2.0.tar.gz
cd gcc-12.2.0
./configure --prefix=/ceph-fj/fangjun/software/gcc-12.2.0
make -j 5
make install
```

```
gcc_dir=/ceph-fj/fangjun/software/gcc-12.2.0
export CC=$gcc_dir/bin/gcc
export CXX=$gcc_dir/bin/g++
export LIBRARY_PATH=$gcc_dir/lib64:$LIBRARY_PATH
export LD_LIBRARY_PATH=$gcc_dir/lib64:$LD_LIBRARY_PATH
export C_INCLUDE_PATH=$gcc_dir/include
export CPLUS_INCLUDE_PATH=$gcc_dir/include
```

## 25.1 Basics

There are two tools: NDK and SDK. Each tool has a version.

Android has a concept of `Android native API level`.

There are three environment variables to set:

- `ANDROID_NDK_ROOT`
- `ANDROID_SDK_ROOT`
- `ANDROID_HOME`

## 25.2 Installation

### 25.2.1 Install NDK on Linux (not recommended)

(Use the following SDK to install NDK)

See <https://developer.android.com/ndk/downloads/index.html>

See [https://www.cryptopp.com/wiki/Android\\_Setup\\_\(Command\\_Line\)](https://www.cryptopp.com/wiki/Android_Setup_(Command_Line)) for details.

```
wget https://dl.google.com/android/repository/android-ndk-r25-linux.zip
unzip -d /ceph-fj/fangjun/software android-ndk-r25-linux.zip
# It will create /ceph-fj/fangjun/software/android-ndk-r25
```

Other versions can be downloaded from <https://github.com/android/ndk/wiki/Unsupported-Downloads>

```
wget https://dl.google.com/android/repository/android-ndk-r24-linux.zip
unzip -d /ceph-fj/fangjun/software android-ndk-r24-linux.zip

# It will create /ceph-fj/fangjun/software/android-ndk-r24
```

Now create a symlink in `/ceph-fj/fangjun/software`:

```
cd /ceph-fj/fangjun/software
ln -s android-ndk-r25 android-ndk
```

Set the following environment variable:

```
export ANDROID_NDK_ROOT=/ceph-fj/fangjun/software/android-ndk
export PATH=$ANDROID_NDK_ROOT:$PATH
```

## 25.2.2 Install SDK on Linux

Download the commandline tools only from <https://developer.android.com/studio#downloads>

```
wget https://dl.google.com/android/repository/commandlinetools-linux-8512546_latest.zip
unzip -d /ceph-fj/fangjun/software/android-sdk ./commandlinetools-linux-8512546_latest.
↳ zip
# Everything is inside /ceph-fj/fangjun/software/android-sdk/cmdline-tools/
cd /ceph-fj/fangjun/software/android-sdk
mv cmdline-tools latest
mkdir cmdline-tools
mv latest ./cmdline-tools/
```

If we don't run `mv cmdline-tools latest`, it will throw the following error

```
$ /ceph-fj/fangjun/software/android-sdk/cmdline-tools/bin/sdkmanager --list
```

```
Error: Could not determine SDK root.
Error: Either specify it explicitly with --sdk_root= or move this package into its
↳ expected location: <sdk>/cmdline-tools/latest/
```

```
sdkmanager --update
sdkmanager --list
```

```
# Install the build tools
sdkmanager "platforms;android-28" "build-tools;28.0.3"
# It will create the following directories inside /ceph-fj/fangjun/software/android-sdk/
#
# build-tools, emulator, licenses, patcher, platform-tools, platforms, tools
```

```
$ sdkmanager --list_installed
Installed packages:=====] 100% Fetch remote repository...
  Path                  | Version | Description                  | Location
  -----              | -
  build-tools;28.0.3    | 28.0.3  | Android SDK Build-Tools 28.0.3 | build-tools/28.0.3
  emulator              | 31.3.10 | Android Emulator              | emulator
  patcher;v4            | 1       | SDK Patch Applier v4         | patcher/v4
  platform-tools        | 33.0.2  | Android SDK Platform-Tools   | platform-tools
  platforms;android-28 | 6       | Android SDK Platform 28      | platforms/android-28
```

```
sdkmanager --help
yes | sdkmanager --licenses # to accept or licenses, the decision is saved in a cache
↳ file.
```

Set the following environment variables:

```
export ANDROID_SDK_ROOT=/ceph-fj/fangjun/software/android-sdk
export PATH=$ANDROID_SDK_ROOT/cmdline-tools/latest/bin:$PATH
```

(continues on next page)

(continued from previous page)

```

export ANDROID_HOME=/ceph-fj/fangjun/software/android-sdk

# for emulator
export PATH=$ANDROID_SDK_ROOT/emulator:$PATH

# for adb
export PATH=$ANDROID_SDK_ROOT/platform-tools:$PATH

# We installed 28.0.3 before
export PATH=$ANDROID_SDK_ROOT/build-tools/28.0.3:$PATH # change it for different versions

```

Now install NDK using sdkmanager:

```

# sdkmanager --list | grep ndk
sdkmanager "ndk;21.0.6113669"
# it will download android-ndk-r21 and will generate
# android-sdk/ndk/21.0.6113669

export ANDROID_NDK_HOME=$ANDROID_SDK_ROOT/ndk/21.0.6113669
export PATH=$ANDROID_NDK_ROOT:$PATH

```

## 25.3 cmake

See

- <https://cmake.org/cmake/help/latest/manual/cmake-toolchains.7.html>
- <https://developer.android.com/ndk/guides/cmake#command-line>
- /ceph-fj/fangjun/software/android-ndk/build/cmake/android.toolchain.cmake

User provided:

## 25.4 hello

In this note, we describe how to build an executable, how to create an emulator, and how to run the executable in the emulator via `adb push`, `adb shell`.

Listing 1: ./code/hello/hello.cc

```

1  #include <iostream>
2
3  int main() {
4      std::cout << "hello world\n";
5      return 0;
6  }
```

Listing 2: ./code/hello/CMakeLists

```

1  cmake_minimum_required(VERSION 3.8)
2
3  project(hello)
4
5  add_executable(hello hello.cc)
```

### 25.4.1 x86

```

export ANDROID_NDK_ROOT=/ceph-fj/fangjun/software/android-ndk
cmake -DCMAKE_TOOLCHAIN_FILE=$ANDROID_NDK_ROOT/build/cmake/android.toolchain.cmake -
-DANDROID_ABI=x86 ..
```

#### Other values:

- -DANDROID\_ABI="arm64-v8a"
- -DANDROID\_ABI="armeabi-v7a"
- -DANDROID\_ARM\_NEON=ON
- -DANDROID\_PLATFORM=android-21
- -DANDROID\_PLATFORM=android-24

```

$ sdkmanager --list | grep system-images | grep x86 | grep android-28
$ sdkmanager "system-images;android-28;default;x86"

$ which avdmanager
/ceph-fj/fangjun/software/android-sdk/cmdline-tools/latest/bin/avdmanager

$ avdmanager create avd --help
$ -k --package : Package path of the system image for this AVD
```

(continues on next page)

(continued from previous page)

```
# (e.g., 'system-images;android-19;google_apis;x86').
# -n --name      : Name of the new AVD [required]
# -b --abi       : The ABI to use for the AVD. The default is to auto-select
#                  the ABI if the platform has only one ABI for its system images
# -g --tag       : The sys-img tag to use for the AVD. The default is to
#                  auto-select if the platform has only one tag for its system
#                  images
$ avdmanager create avd -k "system-images;android-28;default;x86" -n hello -b x86 -g
↳ default
# Use the default option [no] when it prompts:
# Do you wish to create a custom hardware profile? [no]
#
$ avdmanager delete avd -n hello # to delete it
```

```
$ avdmanager list avd
Available Android Virtual Devices:
  Name: hello
  Path: /root/fangjun/.android/avd/hello.avd
  Target: Default Android System Image
          Based on: Android 9.0 (Pie) Tag/ABI: default/x86
  Sdcard: 512 MB
```

```
emulator -avd hello -no-window -no-accel # then, open a new terminal
```

```
# push the binary from code/hello/build/hello

adb push ./code/hello/build/hello /sdcard # not able to use chmod +x in it
adb push ./code/hello/build/hello /data/local
adb shell /data/local/hello
adb shell
generic_x86:/ #
```

```
generic_x86:/ # ./data/local/hello
hello world
```

## 25.5 Android.mk

See [https://developer.android.com/ndk/guides/android\\_mk](https://developer.android.com/ndk/guides/android_mk)

## 25.5.1 hello

Listing 3: ./code/android\_mk/hello/jni/foo.cc

```
1 #include <iostream>
2 int main() { std::cout << "hello world\n"; }
```

Listing 4: ./code/android\_mk/hello/jni/Android.mk

```
1 LOCAL_PATH := $(call my-dir)
2 include $(CLEAR_VARS)
3 LOCAL_MODULE := foo
4 LOCAL_SRC_FILES := foo.cc
5 # include $(BUILD_SHARED_LIBRARY)
6 include $(BUILD_EXECUTABLE)
```

Listing 5: ./code/android\_mk/hello/jni/Application.mk

```
1 APP_ABI := x86
2 APP_STL := c++_shared
```

APP\_STL := c++\_shared is to fix the following errors:

```
ld: error: undefined symbol: std::__ndk1::cout
```

To compile:

```
cd code/android_mk/hello
ndk-build
```

It will generate two directories in hello: libs and obj..

```
adb push libs/x86/foo /data/local
adb push libs/x86/libc++_shared.so /data/local
adb shell
cd /data/local
export LD_LIBRARY_PATH=.
./foo
```

## 25.6 adb

### 25.6.1 install on macos

```
wget https://dl.google.com/android/repository/platform-tools-latest-darwin.zip
# unzip it and you will find the binary `adb`
```

### 25.6.2 install on windows

Go to <https://adbshell.com/downloads> to download it.

### 25.6.3 install on Linux

```
wget https://dl.google.com/android/repository/platform-tools-latest-linux.zip  
# unzip it
```

## 26.1 Install

```
git clone --depth 1 https://github.com/qemu/qemu
cd qemu
```

### 26.1.1 qemu-arm

Refer to <https://github.com/Tencent/ncnn/blob/master/.github/workflows/linux-arm-cpu-gcc.yml>

```
# To generate only qemu-arm
./configure --prefix=/ceph-fj/fangjun/software/qemu/ --target-list=arm-linux-user --
↪disable-system
make -j10

# It generates the executable: ./build/qemu-arm

# If we run `make install`, it will generate
#
# /ceph-fj/fangjun/software/qemu/bin/qemu-arm
#
# Add it to PATH and use it!
```

To run it, we have to download some cross-compile toolchain, e.g,

Go to <https://developer.arm.com/tools-and-software/open-source-software/developer-tools/gnu-toolchain/gnu-a/downloads/8-3-2019-0> to download the toolchain.

```
mkdir /ceph-fj/fangjun/software
cd /ceph-fj/fangjun/software
tar xvf /path/to/gcc-arm-8.3-2019.03-x86_64-arm-linux-gnueabihf.tar.xz

export PATH=/ceph-fj/fangjun/software/gcc-arm-8.3-2019.03-x86_64-arm-linux-gnueabihf/bin:
↪$PATH
```

If we have built an executable using the above toolchain, we can run it with `qemu-arm`:

```
./build/qemu-arm /path/to/sherpa-ncnn
```

It throws the following error:

```
qemu-arm: Unable to reserve 0xffff000 bytes of virtual address space at
0x1000 (Success) for use as guest address space (check your virtual memory
ulimit setting, min_mmap_addr or reserve less using -R option)
```

We can use

```
./build/qemu-arm -B 0x100000000 /path/to/sherpa-ncnn
```

which throws the following new error:

```
(py38) kuangfangjun:qemu$ find /ceph-fj/fangjun/software/gcc-arm-8.3-2019.03-x86_64-arm-
↳ linux-gnueabi/f/ -name "ld-linux-armhf.so.3"
/ceph-fj/fangjun/software/gcc-arm-8.3-2019.03-x86_64-arm-linux-gnueabi/f/arm-linux-
↳ gnueabi/libc/lib/ld-linux-armhf.so.3
(py38) kuangfangjun:qemu$ export QEMU_LD_PREFIX=/ceph-fj/fangjun/software/gcc-arm-8.3-
↳ 2019.03-x86_64-arm-linux-gnueabi/f/arm-linux-gnueabi/libc
```

Now we can restart:

```
./build/qemu-arm -B 0x100000000 /path/to/sherpa-ncnn
```

## 27.1 Basics

### 27.1.1 Extract part of a wave

```
# offset 2 seconds, length 0.195 seconds  
sox in.mp3 out.mp3 trim 2 0.195
```

## 28.1 Install

Refer to <https://mnn-docs.readthedocs.io/en/latest/compile/engine.html>

```
./schema/generate.sh
mkdir build
cd build
cmake -DMNN_BUILD_CONVERTER=ON -DMNN_SUPPORT_DEPRECATED_OP=OFF -DMNN_BUILD_TORCH=ON ..
make -j 10
```
